Account for distribution and reference of anaphoric (reflexive) pronouns like *herself*.

[Note: we are **not** interested here in the homophonous form that is used for emphasis, as in *Mary, herself, killed the snake.*]

An anaphor, like *herself*, must be bound in its clause.

- **Clause:** informally, let's just say that each verb and 'whatever goes with it' constitutes a clause.
- **Binding:** A constituent α of a sentence *binds* another constituent β just in case α and β are coindexed (coreferential) *and* α C-COMMANDS β .
- **C-command:** α c-commands β just in case α does not contain β , but every category that contains α contains β . (This is most easily seen if we draw trees for our sentences and translate *contain* to *dominate*.)

What are the c-command relations in this tree?

There are several types of evidence that support a structural, rather than semantic account of pronoun and anaphor (reflexive) distribution.

The binder is not always an agent or doer:

Binding

Theory:

Anaphors

More on binding

Wh- movement

Non-syntactic
factors?

You are not
your grammar

- *John saw himself.*
- *John looked at himself.*

This difference between agent and experiencer is overtly encoded in many languages.

A semantic account wrongly predicts that the subject of passives could be anaphors:

- **Himself was shot by John.*

Anaphors can never be subjects because there is never anything high enough in the syntactic tree to bind them.

Although all our examples above involved subject antecedents of 'direct objects', there are other possibilities in English:

- *John wrote a letter to himself.*

himself is a recipient or beneficiary, not the result of the writing activity. Compare:

- *This letter wrote itself.*
- *The teacher assigned Mary herself as a buddy.*
- *The psychotherapist revealed Mary to herself*

Binding
